In AutoCAD, code can be written to perform such tasks as creation of arbitrary shapes from user inputs, drawing from scratch in any layer with no need to draw the entire document, or even changing layer properties. Document creation AutoCAD is designed to allow users to create complex documents using an integrated content-creation process that allows for authorship through standard operating procedures and formatting; it is similar to word processing in that complex content creation can be achieved through well-defined procedures with no programming knowledge required. The ability to create a document through an XML interface, versus requiring a programming interface, means that non-programmers can create documents. The ability to directly manipulate the XML document with the use of XML tools allows AutoCAD to perform complex tasks which may be difficult to program. The Windows scripting language, VBScript, and other scripting languages such as AutoLISP and Visual LISP are supported for automation, providing the ability to programmatically access AutoCAD and execute AutoCAD commands. AutoCAD's integrated content-creation tools for both 2D and 3D allow users to develop as many or as few drawings as they need. They are not constrained to the number of drawings in a particular folder. The complexity of a drawing can be easily defined by the type of annotation, the number of views and the number of annotations. With AutoLISP, it is possible to insert different shapes or to draw over existing objects, remove or add annotations, and change layer properties. With Visual LISP, it is possible to insert shaded or unshaded 2D annotations, change the edit and move properties of a layer, and draw curves. In addition, with visual programming tools, such as Visual LISP, it is possible to create more complex objects, such as profiles, as well as execute AutoCAD commands. A learning curve is required to create the most complex documents, and documentation is available. With AutoLISP, it is possible to change the cursor properties of any object in the drawing, change the layer properties of any object, and change the shading or linetype of any object. Document manipulation AutoCAD provides a number of tools to manipulate documents. These tools allow modification of a single drawing object or of the entire drawing, the command to perform a change, the context that the command is performed in and the settings for the change, including the units of the change. This makes it possible to automate repetitive tasks in CAD 5b5f913d15
