In the conventional integrated circuit (IC) device, a plurality of units is formed on a semiconductor substrate, and each unit is electrically coupled to other units through a set of conductive lines or wires (e.g., metal interconnects). Such conductive lines or wires are used to carry the current for the operation of the IC device. In addition, a plurality of other conductive lines or wires (e.g., metal contacts) are also used to make electrical contact with, and provide the supply voltage for, the components of the IC device. As the semiconductor industry has progressed into nanometer technology process nodes in pursuit of higher device density, higher performance, and lower costs, challenges from both fabrication and design have resulted in the development of three dimensional (3D) devices such
