Evaluation of the clinical application of the subarachnoid hemorrhage grading system in predicting the incidence of delayed cerebral ischemia after subarachnoid hemorrhage. The aim of this study was to evaluate the clinical application of the newly developed subarachnoid hemorrhage (SAH) grading system in predicting the incidence of delayed cerebral ischemia (DCI) after aneurysmal SAH (aSAH). Patients with aSAH admitted to our department from January 1, 2013 to June 30, 2015 were enrolled. A total of 1362 patients with aSAH were enrolled, including 929 (70.34%) males and 343 (29.66%) females with an average age of  $56.64 \pm 13.30$  years (range, 16-94 years). The data were analysed by two trained surgeons according to the 2012 SAH grading system. A total of 195 (14.69%) patients developed DCI and 137 (10.62%) patients died during the hospital stay. The incidence of DCI in patients with aSAH of grade I, grade II, and grade III was 7.91%, 11.36%, and 24.36% respectively (P
