Formwork Striking Times Ciria Report 136 Formwork Striking Times. This is a translation of the original article at the request of the user. ¶ The initial time can be determined based on the temperature of the concrete at the time of pouring. CIRIA Report 136 Formwork Striking Times Formwork Striking Times The US: CIRIA Report 136: Formwork striking times criteria, prediction and methods of assessment/.There are many situations in which

the selective removal of a solid impurity from liquid media can be of great benefit. This is particularly important in chemical reactions in which the unwanted products are removed selectively from the reaction products. In the manufacture of some electronic components, impurities in certain components are removed by leaching with acid solutions. There are many situations in which selective removal of a solid impurity from liquid media can be of great benefit. This is particularly important in chemical reactions in which the unwanted products are removed selectively from the reaction products. Cathode ray tubes (CRTs) have provided a popular display device since the 1950's. CRTs utilize a high electron beam to strike phosphors on a screen, which fluoresces the phosphors into a pattern that can be viewed on the screen. CRTs possess many desirable characteristics and have therefore found wide use in many applications. One such application is as a display device for a computer, in which a CRT can display computer data on the screen. A major disadvantage with CRTs relates to the fact that, over time, a CRT loses brightness. This is believed to be due to impurities in the phosphors becoming imbedded in the glass envelope of the CRT, or otherwise bound or adsorbed thereto. To prevent such deterioration, a resin coating is applied to the phosphors of the CRT. The resin is applied by passing the CRT through a coating device which generally includes a pair of opposing arrays of suction cups. A vacuum is applied to one of the cups in each array and suction is applied to the other, so that the cups are drawn against the glass face of the CRT and the phosphors. This method of applying a resin coating to CRTs can produce some very undesirable results. The cups must be very firm, to prevent deformation of the CRT. This makes it difficult to pick up the CRT by the suction cups, which can result in poor placement of the CRT in the cups, resulting in uneven resin coating. Also
