* Two Digital Photography Schools : If you plan to become a digital photographer, you need to get some basic training. This book features two digital photography schools that provide invaluable training for beginners: Classroom-only courses that are highly targeted to entry level photographers, and Internet-based courses that are targeted to those with some experience.

Classroom-Only Courses: • Classroom-only courses typically fall under two categories: basic and advanced. • A basic course is better suited for beginners because it teaches you the essential knowledge and skills you need to create professional-quality digital images. This level of training typically encompasses the following areas:

- The art of using manual controls.
- Basic digital photography concepts.
- Digital imaging equipment.
- Theory of how light and the human eye work.
- Personal ethics.

Some basic-level courses offer an additional Advanced Photo Techniques (APT) course, which often introduces the more advanced aspects of digital photography. The cost of a basic course usually ranges from about \$300 to \$600; the cost of an APT course is usually about twice that of the basic course.

Internet-based Courses: • Internet-based courses typically fall under two categories: short and long. • A short course is better for those with some experience because it provides more in-depth training for you to concentrate on aspects that are needed for moving into the more advanced categories of digital photography. Some of the topics you learn are:

- Using and enhancing the tools of Photoshop to prepare images.
- Understanding the Photoshop workspace.
- The theory of how light and the human eye work.

• The long courses are geared towards advanced photographers and teach you about what it takes to be a professional level photographer. Usually, it's best to sign up for an Internet-based course that is longer than a year in length because it gives you the time and experience to deal with the challenges of being a professional and to bring in the fees required to sustain yourself. Training costs for professional courses range from about

\$1,000 to \$1,500 per year. Many photographers attend the American Society of Photographers' convention, and photograph sites or online forums, to meet photographers with similar interest and training. This can also help you to meet other photographers who

How to Use a Macro Lens Macro lenses allow photographers to control the depth of field. It allows them to focus on a subject that is more apart or more near from the camera. The most common macro lenses include the following; 1. 1:2 Macro lens 2. 1:1 Macro lens 3. 1:3 Macro lens 4. Micro lenses 5. Telephoto lens

How to Use Macro Lenses

1. Control the Depth of Field The depth of field is the area of the picture in which the subject is out of focus. The more the subject is out of focus, the more blurred it becomes. A macro lens is the only way to control the depth of field. A 1:2 lens is the most common type of macro lens. The lens used in a camera, 1:2 lenses move a larger portion of the image in front of the focus points than a normal lens. The depth of field of a 1:2 lens is more than that of a normal lens. This will allow the user to blur parts of the image. When using a 1:2 lens to adjust the depth of field, it is possible to focus on an object or on a set of objects. This is possible by simply moving or shifting the subject.
2. Bokeh Pattern When using a telephoto lens, the camera focuses on a certain subject. This allows the photographer to change the focus. At the same time, it will control the depth of field of the picture and create a beautiful blurred background effect. The background of an image will appear blurred even though the subject is in focus. The look of a macro lens is very distinct. When used with a telephoto lens, the two together create very clear blur when the subject moves.
3. Close Up Effects Micro lenses allow the users to take amazing close up images. Many of the things that can be seen in close up photographs are not visible to the naked eye. The picture above is a micro lens mounted on a telephoto lens. This allows the user to control the depth of field. It also ensures that the subject is focused. The information about the distance between the subject and the camera is not visible in macro photographs. In a close up image, it is possible to zoom in on the subject without zooming the lens of the camera. This will allow the 388ed7b0c7

out their products aren't a fraud. If they don't get enough signs to keep the FDA at bay, they will be shut down and fined before you know it, and we will get something much more expensive and clearly inferior. (All of this while they are laughing all the way to the bank at the expense of consumers.) Because we are all so obsessed with drama, I'll make another prediction: If you are paying \$20 a bottle for a fancy bottled water, you will soon be paying about a dollar a bottle for some water from a company without fancy packaging. And soon the "pennies" will make up a huge part of the price of bottled water. As soon as the bottom falls out of the bottled water industry, that concept will make sense to everyone. As soon as people realize they are paying a ton of money for "fancy" water that's probably just tap water or swimming pool water, just as nasty, and they can get the same quality for a lot less, they will be much more likely to look at the cheaper alternatives. "...the labels help persuade consumers that the water is safe and healthy..." I think that is absolutely right. I think that's the first and only reason. The rest of the claims could be proven or disproven with a simple experiment. Take some tap water. Open a few bottles and put the contents into five clean containers. Fill the rest of the bottles with tap water. Write down what you see. Then open the tap for a while. Taste test and see if the label changed. Some of these bottles will have made the leap to the fancy bottles... due to people's taste and expectations. People will like the taste of these fancy bottles. If they don't, they will drink the tap water that they are putting on the fancy bottles. So the label won't really change anything... People will find their fancy bottle water as they are used to. My guess is that most of the fancy bottles will stay in the fancy bottles category. This is going to affect only very rich people. So rich people might talk about it. It's not going to affect poor people. They will still go to water fountains, sewer systems, washing water tanks, etc. If some company can sell the water to an affluent customer, it's got them. So the market is not what they want. This is not something that will hit the poor until it hits them. The poor will

An object, such as a garment, may be converted into a folded or two dimensional (2D) object by (1) a method of folding, (2) a method of piece-to-piece shaping, (3) a method of laser cutting, and (4) a method of creasing. FIGS. 1A to 1D illustrate methods of folding an object. Referring to FIG. 1A, a method of folding an object generally includes overlapping and securing two pieces of material (a) together to form a single piece of material (a1). One example of a method of folding is U.S. Pat. No. 6,098,879 to A. Anjilinen, et al., entitled "System and method for converting flat textile material into three-dimensional garment." The Anjilinen, et al. method includes securing the two pieces of material together using a mechanical fastening method, such as stitching. Referring to FIG. 1B, a method of folding includes folding the single piece of material (a1) into two pieces of material (a2). In this example, the two pieces of material (a2) are sewn together at a seam. One example of a method of folding is U.S. Pat. No. 6,301,782 to M. Fineman, entitled "Garment and method for making same." The Fineman method includes folding the two pieces of material (a1) into two pieces of material (a2). Referring to FIG. 1C, a method of folding includes folding the two pieces of material (a1) into two pieces of material (a3). In this example, the two pieces of material (a3) are then sewn together at the seam. One example of a method of folding is U.S. Pat. No. 6,237,652 to R. Kendall, entitled "Method and apparatus for shaping garments" In the Kendall example, the method includes folding the two pieces of material (a1) into two pieces of material (a3). Referring to FIG. 1D, a method of folding includes folding the two pieces of material (a1) into two pieces of material (a4) that are then sewn together at the seam. One example of a method of folding is U.S. Pat. No. 6,347,702 to E. Cassagne, entitled "Method
