what is the benefit in a word: speed! the performance of a ramdisk, in general, is orders of magnitude faster than other forms of storage media, such as an ssd (up to 100x) and hard drive (up to 200x). works great on microsoft windows 10. ramdisk is ideal for: windows server 2003 service pack 2 and later ramdisk enables you to use your memory as a fixed or fixed-capacity disk drive, a virtual hard disk, or a virtual memory drive. ramdisk increases performance by providing data that a traditional hard drive storage will not provide. windows vista ramdisk enables you to use your memory as a fixed or fixed-capacity disk drive, a virtual hard disk, or a virtual memory drive. windows vista ramdisk works by reading the contents of your ram into a file. when you need data on your computer, you can access it from ramdisk just like you would access data on an attached disk drive. windows server 2008 and 2008 rc2 ramdisk works by reading the contents of your ram into a file. when you need data on your computer, you can access it from ramdisk just like you would access data on an attached disk drive. ram disk is a way to make your windows computer faster. it is a file called a disk that is stored on your computer's ram. this disk is usually as large as your hard drive and can be used to speed up your computer by providing extra memory for programs. the hard disk normally has a read and write speed far slower than the ram's read and write speed. by putting your software in the ram, the software will not have to wait for the disks to read and write to them.

jigjig is an improved memory allocation tool for the windows operating system. it analyzes the workload of the system and automatically distributes its memory resources by allocating a proportionate amount of memory to each program based on its usage. thus, this can reduce the likelihood of system crashes or memory overloads. ramdrive is a memory-only computer operating system that is designed as a ram-based os for use with x86-based computer systems. it uses the same 64-bit linux kernel as the primary operating system with a few important differences: ramdrive is a complete operating system including file systems, file system drivers, the /bin/sh shell, and, optionally, full shell support. the /bin/sh shell is a posix compliant shell with a small subset of the commands that come with standard unix systems. rbsdkm (repository based disk kernel module) is a kernel module for raid-1 and raid-5 filesystems. it provides a replacement filesystem for the operating system. it can be used to form a local file system for diskless clients in a network environment. rba (ram disk / block acess) is a userspace driver for ram disks. it can be used to create new ram disks or to access ram disks with filesystems. it may be used in a gui installer to distribute a portion of physical ram to a virtual machine. this allows you to install a smaller operating system without using the physical ram. ramdrive is the fastest disk emulator in the world. this is because of how it uses pages and non-paged memory, it also greatly reduces the amount of memory that is required compared to the other disk emulators. some features that are included in ramdrive are floppy emulation and simulating a hard drive. so, while ramdrive does emulate a floppy, it cannot be used for storing data. 5ec8ef588b
