It's a great idea to scan documents created with Photoshop, but for one reason or another, I find that most of the time I don't want to stick documents into the scanner. I want to create images manually, and I want to do that with simple tools that don't scan. I've been a frustrated user of Photoshop for several years, trying to get into the cloud, but I could never get Photoshop to recognize an image as a placeholder that will be rotated or flipped, etc. Adobe finally solved this problem with Photoshop Photo Scan, a free, new app that automatically detects where the image is in the bezel, sets the appropriate rotation and cropping, and then scans with infrared light and sends the file to the cloud. Do you need multiple operating systems at home and work? Adobe now lets you store an image on the cloud—which is the main reason I can't use it, because I use Photoshop in a Linux and an OS X environment. It's true that you can share it online, but it's limited, and I can't make pages suitable for the web from it. Often, neither of my systems is up or running in serious ways, and when I share photos on Facebook, I often give up the link into Lightroom for people to view. If you're a frequent traveler, Adobe has you covered with Elements. You can now save places you've been recently, and you can view it from any machine. I'm using a Mac on my MacBook Pro and having fun. It's working well for travel, although Adobe has not yet addressed the fact that a lot of the places in the world have WiFi hotspots that don't need a login and password.
