DC++ is a network client software solution which is based on the direct connect protocol (DC) but it goes beyond just that, allowing for file sharing, chat and connecting to other DC clients. It is not limited to a single computer or file-share/upload, allowing for users to connect to other DC clients on their local network. The main differences in terms of the direct connect protocol With DC++, the Direct Connect protocol is much more than a file-sharing program. It is actually a combination of direct connect, direct connect plus chat and direct connect plus downloader. Direct connect: is a software solution that was developed by zimbra and allows for sharing files between two or more computer users in a simple way. The basic concept is to connect to the hub and set your local directory. In the case of files, the user has the option of uploading or downloading. Some hubs, however, require that both the upload and download functions are used. Direct connect plus chat: Allows direct connect to be combined with a chat client. The difference with the previous option is that you can have both a direct connect file sharing client and a chat client. The configuration is easy and there are multiple ways to do it. Direct connect plus downloader: Is a downloader client that allows you to download files while chatting. This allows you to download a file in a hub that has a limitation for file uploads, thus avoiding it. Some other features and supported networks Other features that are provided with the software include a bandwidth limitation, encryption, automatic updates, file/folder permissions, detailed monitoring and options for the local firewall to be used. Supported networks: Windows: This solution is compatible with Windows versions, starting from XP. Mac OS X: This software supports Macintosh OS X, from version 10.3 onward. Linux: DC++ is supported by all Linux versions, starting from the kernel version 2.6, which corresponds to the year 2006. iOS: DC++ supports iPhone, iPod Touch and iPad, versions from 2.0 to 5.1. Android: DC++ supports the major Android version from 2.1 to 2.3.1. DC++ is compatible with the following servers: Directconnect.org: This is the default server used by the software. ## What's New in the DC ?

DC++ is a peer-to-peer file sharing software that offers a very simple interface to use. It is a fully free app that requires no installation and is compatible with all Windows versions. Advantages: DC++ is a client-server solution and that means that it does not use the sharing protocols of the Windows OS. It was created by Djinni and has its source code publicly available. The interface is simple and it is possible to avoid any hassle when setting it up. Disadvantages: DC++ is not compatible with all Windows versions, although it is compatible with all Windows versions and Windows editions since Windows XP. If the download is large enough, it might take some time to finish. [www.megaupload.com](http://www.megaupload.com) - 100% FREE DOWNLOAD Megaupload is a popular file sharing website for downloads with almost 5 billion files. Megaupload offers a reliable and professional environment that has attracted many users. DC++ is a software solution that aims to make the whole file sharing experience a lot more pleasant, allowing users to exchange files using the Direct Connect protocol and start conversations within the hubs they access. Typical setup and configuring basic settings The installer is just basic, so clicking Next and accepting the default settings should be enough. However, after this, one might require some computer knowledge to be able to start using the program. First of all, DC++ requires the user to type in an username, pick the Internet connection type and share some files. Most hubs have imposed sharing limits, so users will not be able to enter certain sharing channels unless they share the required amount of data. Secondly, the download folders need to be specified, be them for temporary or completed files, just to be sure everything is organized and easy to locate. In case this step is skipped, DC++ automatically creates two default folders, one for each type of download. Easy-to-handle GUI and some advanced options The interface is very clean and simple, which means that, once users get used to it, everything will work smoothly. The Settings window gives access to a wide range of options, but they are best handled by experts as erroneous modifications can result in poor performance. Power users can adjust the bandwidth limitation, input and use a proxy server, as well as customize the colors displayed within the main window and the chat, and set up preferred notifications. Performance and conclusion Another benefit to using DC++ for your downloads is that the hardware requirements are quite reasonable and therefore, does not stress the PC even when downloading large files at high speeds. Jobs are completed in a timely manner without popping up errors, crashing or freezing. All in all, DC++ remains the most appropriate tool to experiment with the Direct Connect protocol and although there are a lot of tools out there meant to provide nicer interfaces and more advanced features, this one remains a top choice in all the fields.
