Photoshop has many features that were created for the professionals. Professionals, however, are a small percentage of today's graphic design community. A few of the features I'm going to list today will never be a priority for the majority of designers. A few others may be really useful to some designers. It's a matter of weighing your needs with the cardinal rules of graphic design and usability. Mac users should also be aware that while Photoshop does have a Mac version, it's supported by Apple, not Adobe. For the last several versions of Mac OS X, Adobe had no plans to bring Photoshop to the Mac platform. This necessitated a lot of design decisions paying close attention to changes in the Mac OS platform. This is one of those decisions where, as a Mac user you may not agree with the path that Adobe took. You can easily adjust the background color or even change the background color of the entire canvas. You can change the opacity of the Editor and in case you are up to speed on the history and VCS information, you will also be able to change the Blending Modes options. On the bottom of the canvas and also the hide panel, there is a toggle to show the layers panel. The hide panel is always available with View & Edit, although you don't see it if you click on the hold icon there. Photoshop has a timeline, and in case you haven't yet had to look at the timeline, you can add a clip for any area by simply pressing Alt+ Ctrl+M. Select your crop area and right-click to make a note of where the corner is. You will hit Alt+ Ctrl+T to create a new transparent layer. To get to the timeline, press Ctrl+T. From there, you drag your layer to the timeline. This allows you to rotate the layers.
