Allows for communication using real serial port but it can also be used to create a virtual one. This small Python utility (easily ported to other languages) supports the following serial communication protocols: IEEE-1284 SPI SPI-optimized RS-232 RS-232-optimized RS-422 RS-422-optimized RS-485 RS-485-optimized Basic remote configuration, serial-over-RS232 is standard as long as the protocol allows that, sending and receiving line-end-of-message indications, remote command line and program to run, etc. etc. Python serial port redirection is useful for servers like routers, NAS, game servers, and for monitoring and debugging. @samverus - is there a test plan for this code? Most of the current formatter tests, which are to be run as a continuous integration, assume that the code has no changed. When I test the current formatter on the code you linked to, it reports the syntax error. This is a proposed regression test plan for C++/Python as follows: 1) Test all Python files in cpp/templates with different Python versions. 2) Test all Python files in cpp/config.cpp and cpp/config.py with different Python versions. 3) Verify that Python 2.7.10, 3.4.0, 3.4.1, 3.5.0, and 3.6.0 all fail to compile with C++11. @travcp: No, as I said the test case is too specific to check in

one go. The test cases check to verify that the parser works. The actual formatting test cases (which are also discussed in this thread) are very specific to the current format and need to be written specifically. @kevinm: You don't need to delete the Qt SDK you already have, but if you need more, just go to Software Center > Software Sources > Other Software and select the ones you need. @travcp: I understand that that is how it works, but there are some cases where it is mandatory to delete it and some where it is no longer required. I deleted it for a fresh install of Kubuntu 18.10, but it may have been installed before and caused issues. I did not remember how to completely remove it. @travcp: Actually 2edc1e01e8
