As part of the long-  
delayed refurbishment  
of Melbourne's storied  
Flinders Street  
railway station, a new  
sweeping roof has been  
erected for the first  
time since the old  
wattle and nail roof  
was installed in 1910.

The new skillion roof, which includes a cantilever section on its south-facing side, was installed by Engineers Australia in partnership with the Victorian government. It is being used to reduce wind speed and strength on the busy station, helping to mitigate the effects of the station's sails, which allow the station to become warmer during summer days. During construction, workers have reported finding the remains of dozens of jellyfish washed ashore during the construction.

“This is the first time we have had a new roof on the roof on the southern side of the station,” the station manager, Steve Mahood, said. “It is a real milestone in the project, and we wanted to mark it with a

special event for the workers, the community and the media.” The timing was right for a spectacular photo opportunity at sunset on Sunday, Mahood said, after days of high winds and overcast weather. “We decided it was a good time to get the exterior in,” he said. “It’s a very pleasant way to end the week, and the news story will only improve.”

Steganography is the practice of concealing a secret message in a

seemingly innocuous communication channel, such as an email, a photograph, or a printed document. So to answer your question, you need a steganography software that can process 2-bit (black and white) images and 3-bit (color) images, to detect and display the steganography (hidden messages). STEGANOGRAPHY

Steganography is a lightweight and straightforward software solution that allows you to conceal

an archive within a image. The name of the application, steganography, refers to the practice of hiding a message or file within another message or file. Easy to use and clear-cut interface The installation process runs smooth and fast, not bringing any surprises, so in no time you can use the application. Steganography features a clean and intuitive interface where you

can preview the selected image. Hide sensitive data The utility enables you to choose an image file, then an archive, RAR or ZIP, that you want to integrate within the picture. The application provides you with support to open various images types, such as JPEG, BMP, GIF, PNG or IMG. After that, specify the output name of your new image and its location and select the type of

steganography, inside or outside. The inside type of integration hides the archive within the image but increases its size and the outside type saves the archive to a hidden location on your computer.

Furthermore, Steganography offers you the possibility to select a previously created image, that contains the hidden file, and easily open it with your default program for managing

archives. In some cases, during our testing, the application failed to work properly and the output images were corrupted files, as well as the hidden locations of the archives were unavailable or empty.

Conclusion All in all, Steganography proves to be a handy software tool for everyone that wants to protect their data, by hiding it inside images.
