Obviously, with a tool as complex as Photoshop, sometimes there will be a misstep. I'm no computer science major, but if you notice something like the spellcheck automatically turning words to all capitals or the eye dropper jumping to a new file, you can go to Edit→Preferences→Performance and find the Smoke submenu (bottom left corner). There, you can select "Never Smoke" to reverse the effect or "Smoke Corrections", to correct it. It also works in a similar way with the zoom, scroll and drag resolution. In the "Smoke Corrections" window, you can find an option for "Edit" or a number of other options. Clone and Warp tools (<-<->, respectively) are straightforward. The Clone tool is great for cloning a section of a layer to make duplication easier, while the Warp tool can be used to warp a section of an image. The ones you need to watch out for are the Pencil tool, the Airbrush, the selection tools, and Lens Blur. A few things to watch out for when using these tools: when drawing with the pencil, you can create some artifacts and cause the image to become discolored. The Fix option helps to get rid of these issues. If you're not taking all the necessary precautions, you can easily lose all the work you have done with the pencil. In Photoshop, you can crop inside the canvas space frame and move the frame around. You can move and resize image thumbnails in the Viewer panel in Place. And you can reposition the Layers panel to optimize it. To help you with some of the more complicated tasks, the Save command can be assigned to a keyboard shortcut if you'd like. You can even save a trail so that you can edit and modify your photo's appearance and return it to the original picture.

There is also the Gradient Tool and that can be used to help you set colors on any image you choose. If what you want is to create a pattern with colors and they should stay set, you can use the Gradient tool to do that. Using the Gradient tool, you can create a color gradient for your image. In order for this tool to be effective, you need a good understanding of colors and colors theory. There are pre-made gradient palettes to load into the gradient tool, but if you want to create your own gradient, you'll need to understand the color wheel and the trade-offs of using one color over another. Your results can be very cool, even if you don't understand everything you're seeing in your image. You can also use the Paint Bucket Tool to remove unwanted colors instead of just using your color palette. There are also some special brushes supplied mainly for textures that are really very easy to use. Some of them are the Diamond Brush, the AirBrush, the Stipple Brush, the Spatter Brush, and the Blob Brushes. Last, but definitely not least are the adjustment layers. They're supposed to be removed when you're done, but I have found that when I open up my images I want to start over. I've had to go back into most of my images just to make some tweaks. **Which app should we use to perform graphic design?**

But, what software should be used as a graphic design tool? In my opinion Photoshop is the best as it has a collection of functions that make it extremely easy to use and work on. These include:
