But Adobe has been working on this problem for decades. Chris Milk's 2005 project, Camera v2 , was designed to solve the complexity of organizing and editing different sets of files. Motion, a project to improve the way we do animation, was designed to automate the transitional flow of images, whether it's a short video clip or a series of snapshots.

Photoshop has a problem in that customers come in and expect to buy a finished product. That means when trying to figure out why a feature performs say, 6% better than we thought it was, customers have to download several files, figure out how to bring them all into the same creative suite to perform operations in one place, then analyze the results. If our feature was made of steel, we'd never get to try it. So we needed a way to help an individual figure out why a workflow or feature is failing without them having to download a zillion files and try to figure out what to do next.

Unified workflow is a common need and at XMPie we've delivered a variety of products such as the Putty product to help solve this common working landscape. Adobe delivers a workflow digitizer called Touché that helps designers think about workflow around image assets. Most recently for Touché we've delivered the new Touché Labs product to help folks understand the nature of an asset and how it relates to all the other assets in their workflow, allowing users to discover what happens when they edit with different files. This is one of the reasons that the Master Collection became the Lumix DMC series where you have the ability to tap into the design of the camera and all the processing of the sensor.

AI tools like AI Brushes, AI effects filters, and editing/workflow enhancements all benefit from using Sensei. You don't have to have a subscription to the Creative Cloud itself to access Adobe Sensei, however, you do need to have a paid subscription to Adobe creative cloud's AI tools. Filters are a new collection of effects embedded within Photoshop that leverages Adobe Sensei to analyze your image and suggest new edits, including Instant Fix, Lens Correction and more. The filter is accessed by choosing Filters > Vision > Suggest. The filters are located in the main menu when you're in the Layers panel. The filter workspace includes slots for suggested changes and the action used to capture that change, for example, fixing a lens distortion. The filters were a preview at the Adobe Summit. With Version 14.2, the filters can be used in versions prior to CS6 on an off-the-shelf machine, too.

Adobe Sensei AI will deliver even greater and more contextual auto-enhancements such as contrast and saturation from on-device image recognition and machine learning for new shades of grayscale and for black and white conversions. Support for deeper exposure and feel for new and fine-tuned brush strokes, plus the integration of live text, will help users capture moments in fresh and creative ways, now and in the future. New Focus Burst Effect options offer users the ability to control the look of the background behind objects, introduce a shadow or blur, or create a background wrap, without any post-processing pixels.
